MET Brain Structure (MBS)

A Structural Runtime Perspective on Dreaming, Cognition, and Intelligence

Sizhe Tan

with chatGPT (OpenAI)

2026-06-08

Repository: <https://github.com/sizhet/MET-Brain-Structure-MBS>

Welcome.

This repository explores a simple but ambitious question:

What minimal structural architecture could support dreaming, memory, imagination, danger response, learning, planning, cognitive convergence, and continuous adaptation?

The answer proposed by this project is called:

MET Brain Structure (MBS).

MBS is not a neuroscience theory.

MBS is not a replacement for neuroscience.

MBS is not a theory of consciousness.

Instead, MBS is a structural exploration.

It attempts to organize a wide range of observations about biological cognition through a common architectural perspective.

The project emerged from a surprising direction.

Not from brain science.

But from research in:

- Structural Intelligence
- Calling Graphs
- Function Tunnel Intelligence (FTI)
- Function Tunnel Math and Networks (FTMN)
- Autonomous Structural Intelligence (ASI)
- Human-AI Hybrid Cognition

Over time, these investigations repeatedly revealed similar structural patterns:

Triggering.

Retrieval.

Pathways.

Runtime activation.

Scene construction.

Continuous adaptation.

Eventually a natural question emerged:

Could biological cognition itself be organized around similar structural principles?

This repository explores that possibility.

Why This Repository Exists

The brain remains one of the greatest unsolved scientific mysteries.

Neuroscience has provided extraordinary observations.

Cognitive science has revealed countless insights.

Artificial intelligence has demonstrated powerful computational capabilities.

Yet many questions remain.

Why do animals dream?

Why are danger responses so fast?

Why do memories often appear as scenes rather than isolated facts?

Why do different individuals frequently converge toward similar cognitive structures?

Why do imagination, planning, memory, navigation, and dreaming feel strangely related?

MBS attempts to examine these questions through a common structural lens.

The Core Idea

The central idea of MBS can be summarized as:

Environment

Trigger

Retrieval

Graph / Tunnel Activation

Embodied Scene Runtime

Action / Simulation

Learning & Evolution

Rather than viewing cognition primarily as symbolic computation, MBS

explores the possibility that cognition may emerge from continuous activation and evolution of structural pathways.

This idea is referred to as:

Trigger–Retrieval–Tunnel Architecture (TRTA).

Why Dreaming Animals Matter

One of the most important observations behind MBS is surprisingly simple. Humans dream.

Dogs appear to dream.

Cats appear to dream.

Many mammals exhibit dream-like sleep behavior.

This matters because dreaming appears to exist far below language, mathematics, symbolic reasoning, and civilization.

Dreaming may therefore expose ancient runtime mechanisms that existed long before human intellectual systems emerged.

From the MBS perspective:

Dreaming is not merely a curiosity.

It is evidence.

Why Danger Matters

Danger is one of the most powerful forces in evolution.

An organism facing immediate danger cannot afford:

- Exhaustive reasoning
- Perfect optimization
- Complete world modeling

Instead, survival favors:

Detect

↓

Retrieve

↓

Activate

↓

Act

This pressure may have shaped cognition itself.

The MBS project refers to this perspective as:

MET Selection

(Minimal Evolution Threshold Selection)

The architecture does not need to be perfect.

It only needs to be effective enough to survive.

Why Scenes Matter

Another key idea in MBS is:

Embodied Scene Runtime

When humans remember.

When they imagine.

When they plan.

When they dream.

They often do not experience isolated symbols.

Instead, they experience scenes.

Places.

Objects.

Movement.

Relationships.

Goals.

Emotions.

The MBS hypothesis proposes that scenes may be among the primary runtime units of cognition.

Why Cognitive Convergence Matters

One of the most intriguing ideas explored in this repository is:

Trigger Convergence

Traditional explanations often focus on:

- Genetics
- Environment
- Culture
- Learning

MBS proposes an additional mechanism.

Different organisms frequently face similar survival pressures.

Similar survival pressures produce similar triggers.

Similar triggers produce similar retrieval structures.

Similar retrieval structures produce similar functional pathways.

Over time:

Environment

Triggers

Retrieval

Tunnels

Cognition

This may help explain why cognitive convergence appears repeatedly throughout nature.

Relationship to Neuroscience

This repository is built with deep respect for neuroscience.

Neuroscience provides:

- Observations
- Experiments
- Biological evidence
- Clinical findings
- Imaging data

MBS attempts to provide:

- Structural interpretation
- Architectural organization
- Computational analogies
- Digital model references

The relationship is complementary.

Not competitive.

The goal is not to replace neuroscience.

The goal is to learn from neuroscience.

Relationship to Artificial Intelligence

MBS also emerged from decades of questions about artificial intelligence.

Many AI systems excel at:

- Pattern recognition
- Language generation
- Optimization

Yet biological cognition still appears different in important ways.

MBS suggests that future intelligent systems may require:

- Trigger systems
- Retrieval governance
- Embodied scene runtime
- Functional tunnel execution
- Continuous structural adaptation

This makes MBS both a brain project and an AI project.

Suggested Reading Order

For most readers:

MBS-001 START HERE

↓
MBS-002 MBS Core Thesis
↓
MBS-003 Why Dreaming Animals Matter
↓
MBS-004 Trigger-Retrieval-Tunnel Architecture
↓
MBS-005 Danger Response and MET Selection
↓
MBS-006 Embodied Scene Runtime
↓
MBS-007 Cognitive Convergence
↓
MBS-008 Relation to Modern Neuroscience
↓
MBS-009 Relation to AI and ASI
↓
MBS-010 Future Directions
This sequence follows the logic by which the MBS hypothesis itself emerged.

A Note of Humility

The brain remains extraordinarily complex.

No existing theory fully explains it.

Not neuroscience.

Not cognitive science.

Not artificial intelligence.

And certainly not MBS.

This repository should therefore be viewed as an exploration rather than a conclusion.

Some ideas may prove useful.

Some may require revision.

Some may eventually be discarded.

That is expected.

The purpose of MBS is not certainty.

The purpose of MBS is investigation.

Final Thought

Many theories of intelligence begin with reasoning.

MBS begins somewhere older.

Dreams.

Danger.

Triggers.

Scenes.

Paths.

Adaptation.

The possibility explored in this repository is that intelligence may not have begun with thought.

It may have begun with significance.

With the ability to recognize what matters.

To activate what is relevant.

To follow useful paths.

And to adapt those paths across a lifetime.

Whether this perspective ultimately proves correct remains an open question.

But it is a question worth exploring.

Welcome to MET Brain Structure.
